Autodesk AutoCAD is a commercial computer-aided design (CAD) and drafting software application. Developed and marketed by Autodesk, AutoCAD was first released in December 1982 as a desktop app running on microcomputers with internal graphics controllers. Before AutoCAD was introduced, most commercial CAD programs ran on mainframe computers or minicomputers, with each CAD operator (user) working at a separate graphics terminal. AutoCAD is also available as mobile and web apps. CAD The primary purpose of Autodesk's AutoCAD design software is to create and maintain 3D models of real-world spaces and architectural drawings. The field of view is the perspective seen by the user when drawing. The three-dimensional (3D) model contains a series of lines called entities, which intersect in 3D space. There are many types of entities, but they can all be broken down into simple, geometric objects such as walls, doors, roofs, and furniture. The other, more sophisticated functions of AutoCAD are specialized to the type of work being done. For example, in architectural design, the Drafting and Routing submenu allows the user to plan the road and building layout of the design. In mechanical engineering, the Drafting and Part Design submenu allows the user to design, engineer, and build parts and assemblies of their product. When complete, a 3D representation of the designed assembly can be rotated and viewed from any direction, and the relationships of all parts can be examined. In Electrical Engineering, the Power submenu allows the user to design, engineer, and build electrical systems. When complete, the system can be tested by generating a vector-based file, the output of which is plotted on the CAD model. The sequence is tandemly arranged in head to tail arrays as shown in the example below. The sequence has been used in the construction of an all Drosophila DNA microarray. So far we have analyzed the expression pattern of more than 1,000 independent genes, selected from a total of 1,200 sequences. The pattern is remarkably accurate and usually the same in three independent experiments. This result suggests that the pattern is produced by a single mechanism, rather than being the result of a 'housekeeping' gene product. Maternal age and human papillomavirus infection of the cervix. There is conflicting evidence that maternal age influences the risk of human papillomavirus (HPV) infection and cervical neoplasia. The purpose of this study was to assess whether young maternal age is associated with a higher prevalence of HPV and a higher rate of cervical cancer. A case-control study was conducted between 1990 and 1996 in Finland. A total of 633 women diagnosed with cervical cancer were interviewed. In addition, 1359 women with normal cytology were interviewed. Cases and controls were matched by age and county. HPV was detected using polymerase chain reaction. The cervical cancer risk increased with increasing maternal age (relative risk for
