Natural elastic fibers and collagen fibers have been found by mechanical tests to be distinct. While both are elastic, natural elastic fibers retain their original shape after being compressed, whereas collagen, when attached to the surface of the cell by other subcellular matrix constituents, undergoes extensive irreversible shape changes. Biochemical analysis has revealed that natural elastic fibers are rich in elastin, a highly insoluble protein of the tropoelastin family, while collagen is predominantly composed of proteoglycans with tropocollagen and tropoelastin protein core domains. The structural similarities and differences between elastin and collagen have not permitted a unified model for elastic fibers to be proposed. A molecular model is proposed that accounts for observations of the mechanical properties of natural fibers and collagen and that may help to explain their different responses to compressive forces. It is suggested that when a cell is mechanically compressed, tropoelastin is first converted to gelatin and insoluble elastin that does not contribute to elasticity. In a subsequent phase, insoluble elastin is cross-linked with collagen molecules, forming an elastin cross-linked with collagen network (el/col network) that accounts for the compressive resilience of elastic fibers. Since the el/col network also forms the bulk of the natural elastic fibers, it is the dominant structure in natural elastic fibers. In contrast, in collagen fibers the elastin is predominantly associated with the surface of the cell and does not contribute to the bulk of the fiber. At the surface of the cell, proteoglycan accounts for the attachment of the collagen fiber to the cell surface. This, and the small diameter of the collagen fiber, account for its greatly reduced resistance to compressive forces and inability to recover to its original shape. It is now the second year in a row that Fourier's law has been measured by the latest edition of Berkeley Lab's Advanced Light Source (ALS) and the direct observation of Poiseuille flow on a single 3da54e8ca3
